Delta-ee unveils guidance on creating successful heat pump markets

20 August 2013

Delta Energy & Environment (Delta-ee), in association with the European Heat Pump Association, is launching a new guide that showcases European best practice to build successful, sustainable heat pump markets.

More than 750,000 heat pump systems are installed annually in Europe, and about 5.4m systems have been deployed since 2005.

Heat pumps offer a huge untapped potential for energy-efficiency and emission savings, especially in markets where the technology is just emerging and its benefits are only now being recognised.

The guide is aimed at all stakeholders inside and outside the heat pump industry, helping them implement five guiding principles that will establish solid foundations for growth.
